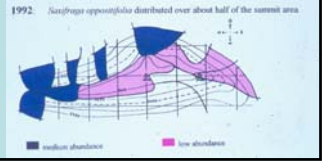

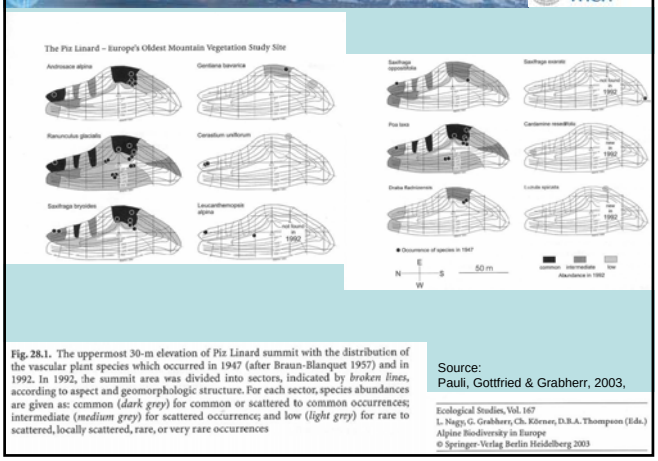

Fig. 28.1. The uppermost 30-m elevation of Piz Linard summit with the distribution of the vascular plant species which occurred in 1947 (after Braun-Blanquet 1957) and in 1992. In 1992, the summit area was divided into sectors, indicated by *broken lines*, according to aspect and geomorphologic structure. For each sector, species abundances are given as: common (*dark grey*) for common or scattered to common occurrences; intermediate (*medium grey*) for scattered occurrence; and low (*light grey*) for rare to scattered, locally scattered, rare, or very rare occurrences

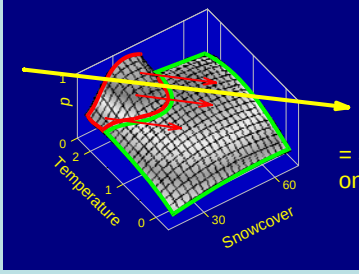
Gottfried et al. 2002, Mountain Biodiversity - A Global Assessment (ed. Körner)

Mean night-time temperature (June-July)

Days with snow cover (May-June)

Measuring Climatic Gradients / Scenarios

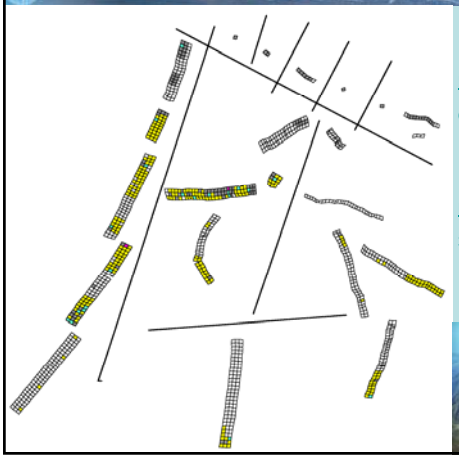
Scenario 2: Temperature +, Snow -



= Strong pressure on nival species

GLORIA-Europe: Some results

The regional re-investigation

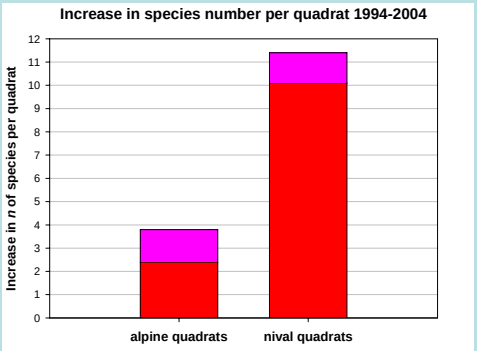


First investigation 1994:

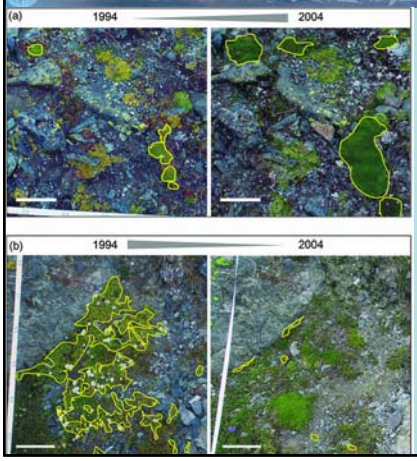
c. 1000 quadrats

Re-investigation 2004:

374 quadrats, c. 40%



species richness increase is BY FAR higher in NIVAL than in ALPINE habitats



Alpine species pool:
cover increase;
e.g., Silene exscapa

Nival species pool:
cover decrease;
e.g., Cerastium uniflorum

All nival species decrease, almost all alpine species increase in cover !

Alpine, alpine to nival, nival species

COVER ↑ INCREASED	COVER ↓ DECREASED
Cerastium cerastoides	*Androsace alpina*
Erigeron uniflorus	*Carex curvula*
Festuca intercedens	*Cerastium uniflorum*
Oreochloa disticha	*Luzula spicata*
Pedicularis asplenifolia	*Phyteuma hemisphaeric.*
Saxifraga seguieri	*Poa laxa*
Sibbaldia procumbens	*Potentilla frigida*
Silene exscapa	*Ranunculus glacialis*
Leucanthemopsis alpina	*Saxifraga bryoides*
Veronica alpina	*Saxifraga oppositifolia*

GLORIA - Global Observation Research Initiative in Alpine Environments

GLORIA co-ordination
Dept. of Conservation Biology, Vegetation and Landscape Ecology
University of Vienna, Austria
www.gloria.ac.at

Contents

The purpose of GLORIA

is to establish and maintain a long-term observation network for the comparative study of the effects of climate change on mountain biota

High mountains, being controlled by low temperatures, are globally distributed from the tropics to the polar regions.

Comparatively low impacts from human land use.

Mountain environments host an outstandingly diverse and highly specialised flora.

The roots of GLORIA — observed changes

Treeline advances observed, e.g., in the Scandes, Bulgaria, Urals, New Zealand, Alaska

Southern Ural

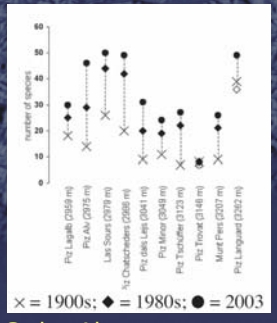
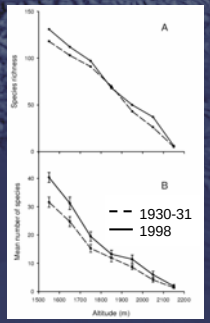
The roots of GLORIA — observed changes

Upward shifts of alpine plant species



Swiss Alps
Walther et al. 2005, Journal of Vegetation Science



S-Scandes, Norway
Klanderud & Birks 2003. The Holocene

The roots of GLORIA — brief history

1994: Schrankogel – permanent plot study at the alpine-nival ecotone

1996: IGBP-meeting – Kathmandu – recognising the demand for long-term monitoring sites in mountain regions

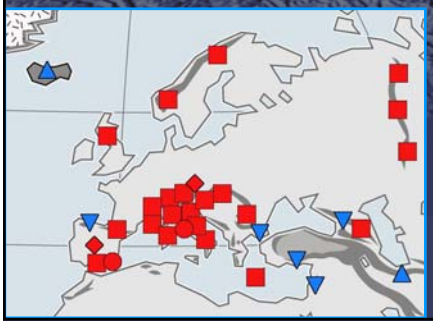
1997-2000: ALPNET – ESF-project on European mountain biodiversity - permanent plots largely lacking

1998-1999: first GLORIA test summit (NE-Alps/Sierra Nevada)

2001-2003: GLORIA-Europe (FP-5), continent-wide setup

GLORIA: Global Observation Research Initiative in Alpine Environments

Start 2001 with GLORIA-Europe:



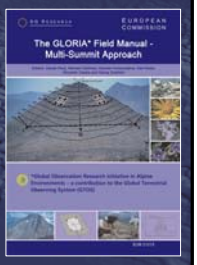
•EU FP5
•24 partners
•18 target regions

•Co-ordination:
Grabherr et al., Vienna

The Multi-Summit Approach

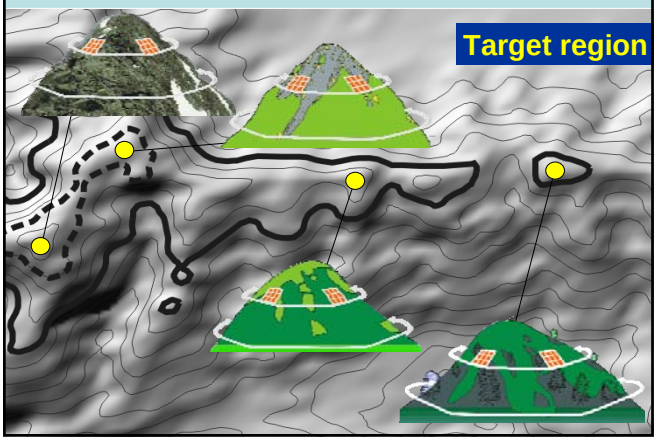
GLORIA's basic sampling design

- focus on summit sites
- vascular plants; *cryptogams optional*
- a fairly inexpensive standardised method for long-term monitoring above the treeline
- should be applicable on a global level



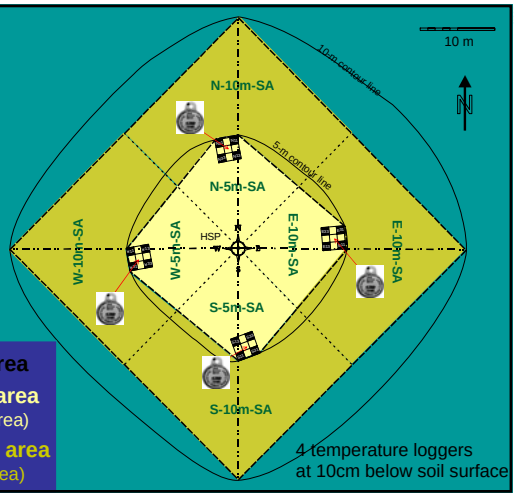
available at
www.gloria.ac.at
in English, Spanish, and Chinese

The Multi-Summit Approach



The Multi-Summit Approach

Plot types

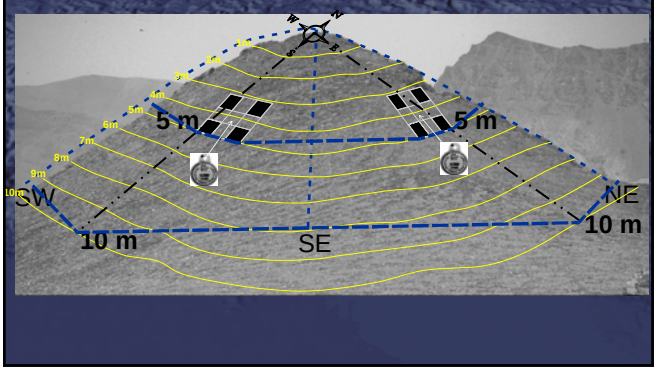


16-quadrat area
5-m summit area
(upper summit area)
10-m summit area
(lower summit area)

4 temperature loggers at 10cm below soil surface

The Multi-Summit Approach

Plot types



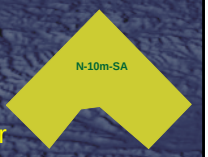
Species recording

- Vegetation sampling in the 1 x 1 m quadrats by visual %-cover estimation of species (changes in species composition and cover)

- Frequency counts of species in 100 cells per 1m² (changes in spatial species patterns)

Species recording

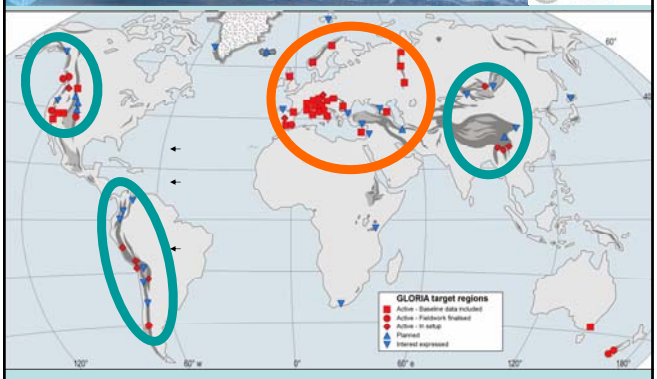
- Species sampling in the summit area: complete species list plus species abundance / cover (species invasions, comparison of species richness)



- Photo documentation

The GLORIA target regions (March 2007)

Target region	Europe	Asia	Austral-asia	North America	South America	Africa
Active	27	3	3	8	5	0
Planned or in setup 2006/2007	2	4	0	4	2	0
Interest expressed	5	8	0	4	4	2



- Implementation of new target regions
- Planning of the European monitoring campaign 2008: model prove

The GLORIA target regions (March 2007)
